

## **Fork Positioner for Forklift**

Forklift Fork Positioner - The fork positioner is a hydraulic device which could allow the person driving to be able to operate the forklift without leaving the seat. They are made out of high quality materials and are meant to withstand the most challenging operations and work surroundings. Side shifting units have the added ability to be able to laterally position the entire load or the arms so as to facilitate much more precise lifting and position in a faster and much more effective method.

The fork pocket is somewhat unique and can enable the one operating it to securely sway the blades into position without any worry of damaging the positioning cylinders. This allows the driver the option to be able to perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be converted into fork positioners on available units.
