

## Grapples for Forklifts

Grapple for Forklift - Grapples work along with the crowning operation of the bucket cylinder located on the excavator. They can mount directly onto the jib or whatever quick hitch which is in bucket position. Grapples are usually meant for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This manufactured design provides the grapple with utmost strength and support by stopping the body from breaking and turning through its function.

The grapple and all of its moving parts are made out of hardened steel. The revolving points are designed in order to ensure holding ability and supreme closing force. The one operating it has the capacity to handle different sizes and varieties of materials due to the jaws built-in at the end of the grapple with toes. This can enable the jaws to be able to close through one another in a finger configuration for maximum handling capacity.
